

Hotel Booking Cancellations Analysis

Project Objective

The objective of this project is to analyze hotel booking data to identify the key factors influencing booking cancellations. By understanding customer behavior, seasonal trends, and cancellation patterns, the project aims to help hotels improve revenue management, reduce cancellations, and enhance overall customer satisfaction.

Dataset Description

The dataset contains detailed information about hotel bookings, including customer demographics, booking details, lead times, room types, special requests, and cancellation status. Each record represents a single hotel booking, providing valuable insights into customer behavior and booking trends.

Tools Used

Tool	Purpose
Microsoft Excel	Data cleaning, pivot tables, and visualization
Python (Pandas, Matplotlib, Seaborn)	Data analysis and trend identification
Power BI	Dashboard creation and interactive reporting

Key Insights / Findings

- A significant percentage of cancellations were made by customers with longer lead times. - Bookings from online travel agencies had higher cancellation rates compared to direct bookings. - Families and group travelers showed lower cancellation rates than single travelers. - The city hotel experienced more cancellations during peak season due to higher pricing. - Customers with special requests were less likely to cancel, indicating higher commitment.

Conclusion

This project provides valuable insights into hotel booking behavior and cancellation trends. By implementing data-driven strategies—such as adjusting pricing, offering flexible policies, and enhancing customer engagement—hotels can effectively reduce cancellations and optimize occupancy rates.
